4

Kidney Functions

- Removal of toxins, metabolic wastes, and excess ions from the blood
- Regulation of blood volume, chemical composition, and pH
- Gluconeogenesis during prolonged fasting
- Endocrine functions
 - Renin: regulation of blood pressure and kidney function
 - Erythropoietin: regulation of RBC production
- Activation of vitamin D

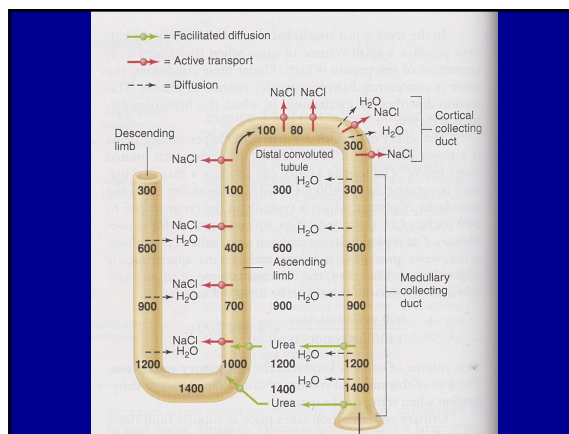

5

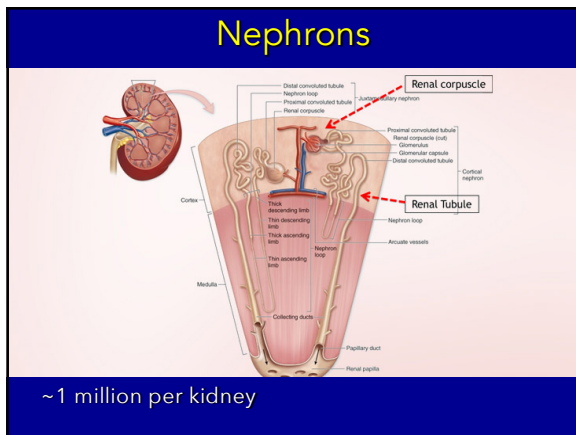

6

7

8

9

Glomerular Filtration

- Passive mechanical process driven by hydrostatic pressure
- Governed by (and directly proportional to)
 - Total surface area available for filtration
 - Filtration membrane permeability
 - Net filtration pressure
 - Particle size
 - Charge on the particle

10

Glomerular Filtration

- Passive mechanical process driven by hydrostatic pressure - primarily
- Indirectly measured by creatinine and creatinine clearance calculation

Stage of Disease	Description	GFR* (mL/min per 1.73 m ²)
1	Kidney damage with normal or increased GFR	≥90
2	Kidney damage with mildly decreased GFR	60–89
3	Moderately decreased GFR	30–59
4	Severely decreased GFR	15–29
5	Kidney failure	<15 (or undergoing dialysis)

11

Glomerular Filtration

Afferent arteriole: Glomerular hydrostatic pressure (60 mm Hg)

Efferent arteriole: Glomerular colloid osmotic pressure (32 mm Hg)

Bowman's capsule: Bowman's capsule pressure (18 mm Hg)

Net filtration pressure (10 mm Hg)

Net filtration pressure = Glomerular hydrostatic pressure (60 mm Hg) - Bowman's capsule pressure (18 mm Hg) - Glomerular oncolytic pressure (32 mm Hg)

12

Opposite forces affecting GFR

- Prostaglandin E₂
 - Vasodilator that counteracts vasoconstriction by norepinephrine and angiotensin II
 - Prevents renal damage when peripheral resistance is increased

13

BUN:Creatinine ratio

(in the setting of renal failure / elevated creatinine)

Pre-renal

- >20:1
- Heart failure
- Shock
- Blood loss

Renal

- <10:1
- Infections
- Toxins/Drugs
- Direct trauma

Post-renal

- 10-20:1
- Urinary tract obstructions

Pre-renal

- >20:1
- Heart failure
- Shock
- Blood loss

Renal

- <10:1
- Infections
- Toxins/Drugs
- Direct trauma

Post-renal

- 10-20:1
- Urinary tract obstructions

14

Primary regulators

- ↓ Blood volume and/or blood pressure
- ↑ K^+ in blood

Other factors

- Stress
- Pain
- Heart failure

RAAS Pathway: Renin → Angiotensinogen (liver) → AT1 → ACE (in the lungs) → ATII

Effects of ATII: Vasoconstriction, ADH release from...?, CNS thirst response, Na/H exchanger

ADH release from...?: Vasoconstriction, CNS thirst response

ADH release: Vasoconstriction, CNS thirst response

ADH release: Vasoconstriction, CNS thirst response

ADH release: Vasoconstriction, CNS thirst response

15

ICO

↓ Renal Blood Flow → **RAAS Activation** → **↑ Afterload**

↑ Sympathetic NS Activation → **α receptors** → **↑ Afterload**

↑ Sympathetic NS Activation → **β receptors** → **↑ SV** → **↑ HR** → **Volume overload**

16

Active transport: NaCl (out), H₂O (in)

Passive transport: H₂O (out), NaCl (in)

ADH stimulation: Aquaporins get deposited by ADH stimulation

BL surface: Basolateral surface

(b) Maximal ADH

Small volume of concentrated urine

17

Hypothalamus → **Posterior Pituitary** → **Vasopressin**

Vasopressin → **V₁** → **Blood Vessels (Constriction)** → **Increased Systemic Vascular Resistance**

Vasopressin → **V₂** → **Kidneys (Fluid Reabsorption)** → **Increased Blood Volume**

Increased Systemic Vascular Resistance + **Increased Blood Volume** → **Increased Arterial Pressure**

18

Major causes of Kidney Failure

- Prerenal Disease
- Vascular Disease
- Glomerular Disease
- Interstitial/Tubular Disease
- Obstructive Uropathy

19

Remember this...

<ul style="list-style-type: none"> ■ Fat (lipid) soluble <ul style="list-style-type: none"> - Basic pH (NH₃⁺ to NH₂) - Can cross membranes - Uncharged (neutral) - Non-polar - Lipophilic - Processed by liver - Nuclear or cytoplasmic receptors - Requires carrier protein - Long half-life - High volume of distribution - Small molecule 	<ul style="list-style-type: none"> ■ Water soluble <ul style="list-style-type: none"> - Acidic pH (COOH to COO⁻) - Does not cross membranes - Charged - Polar - Hydrophilic - Processed by kidneys - Cell surface receptors - Has no carrier protein - Short half-life - Low volume of distribution - Large molecule
--	--

29

Steroids

- Mechanism of Action "I-KISS"
 - I – Inhibits Phospholipase A₂
 - K – Kills T Cells and Eosinophils
 - I – Inhibits Macrophage Migration
 - S – Stabilizes Mast Cells
 - S – Stabilizes Endothelium

30

Steroids

- Mechanism of Action "I-KISS"
 - I – Inhibits Phospholipase A₂

31

Steroids

- Mechanism of Action "I-KISS"
 - K – Kills T Cells & Eosinophils
 - I – Inhibits Macrophage Migration
 - S – Stabilizes Mast Cells
 - S – Stabilizes Endothelium

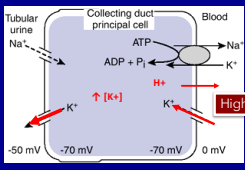

32

Renal drugs

33

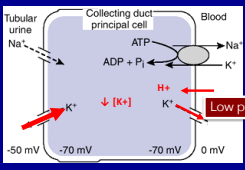

EFFECTS OF ACID-BASE DISTURBANCES on K⁺

Alkalosis = HypoK

+ for +

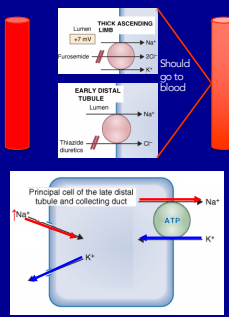

Acidosis = HyperK

34

Effects of loop & thiazide diuretics on K⁺

- Net effect: ↑K excretion → **hypokalemia**
- Loop diuretics block Na-K-2Cl co-transporters
- Thiazide diuretics block Na-Cl co-transporter
 - ↓Na⁺ delivery to the principal cells in the CD → ↑Na⁺ diffusion into the cells via luminal membrane → ↑Na⁺ pumping out of the cell by Na-K ATPase → ↑K⁺ influx into the cell & K⁺ into urine

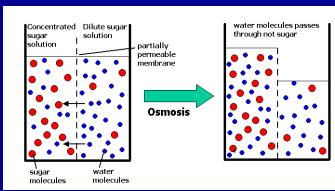

35

Renal Pharmacology

Osmotic Diuretics

- Mannitol (Osmitol)
 - Increases Urine Output
 - Increases Fluid Osmolarity in Tubules

36

Renal Pharmacology

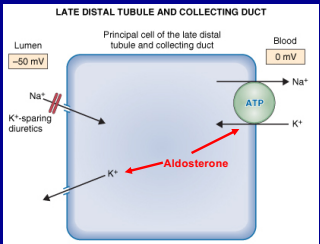

Loop Diuretics

- Furosemide (Lasix)/ Ethacrynic Acid/ Bumex
 - Inhibit Na/K/2Cl in the Thick Ascending limb of the Loop of Henle
 - Stimulates the Release of PGE
 - Action of PGE Inhibited by NSAIDs
 - Ethacrynic Acid- Does NOT have Sulfur

37

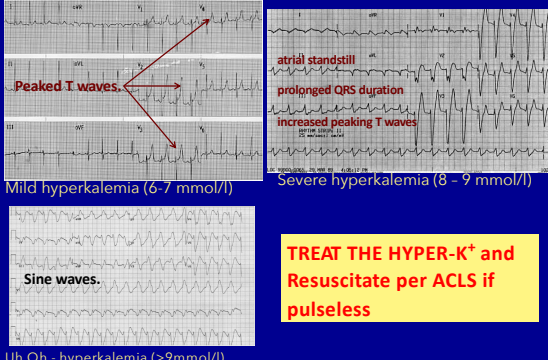

EFFECTS OF K-SPARING DIURETICS ON K⁺ EXCRETION

- Do not cause K⁺ loss via urine
- Mechanism: inhibition of stimulatory effect of aldosterone on Na⁺ reabsorption and K⁺ secretion

38

Hyper K -Cardiac Arrhythmia's - ECG changes

TREAT THE HYPER-K⁺ and Resuscitate per ACLS if pulseless

39

Hyper K- Cardiac Arrhythmia's

- Ventricular dysrhythmias
- Asystole

K⁺ is the problem...

High levels of K⁺ will cause the heart to become more positive and closer to threshold and ultimately prolong repolarization leading to a long QT

40

ACUTE management

ED MANAGEMENT KEYS

- Stop all Medications that can cause HyperK
- Maintain HCO3- drop, NOT BOLUSES
- Consider re-loading Calcium
- If removal of K⁺ is not accomplished in the ED, repeat any Potassium-shifting therapies

CKD = DIALYSIS KANEXALATE

ONLY WAY TO RID THE BODY OF K⁺: Dialysis, Diuresis, Kayexalate

Calcium Drug: Calcium Chloride MOA: competes with K ⁺ Onset: 5 mins Duration: 30-60 min Dose: 100mg (10mL of 10%) Drug: Calcium Gluconate (preferred) MOA: competes with K ⁺ Onset: 5 mins Duration: 30-60 min Dose: 300mg (30mL of 10%)	Insulin/Glucose Drug: Insulin (regular) MOA: increases Na/K ATPase activity, moves K ⁺ intracellularly Onset: 30 mins (peak) Duration: 4-6 hours Dose: 0.1-0.2mg/kg in 50mL of 50% D5W over 10 minutes (10-20mg of 100mg/10mL insulin) followed by 25-50g of 50% D5W (10-20mL of 50% D5W) If K ⁺ is > 2.5 mEq/L, the 100 mg and 0.1 mg/kg are not recommended. Monitor BGL.	Beta2 Agonists Drug: Albuterol (inhalant) MOA: beta2 agonist Onset: 15-30 mins Duration: 1-2 hours Dose: 2-4 inhalers in 10-15 mins, if 0.2mg inhaler use 7-8 hours. If Albuterol AMBROSOL are not recommended. Albuterol MDI is preferred. Magnesium sulfate. Short-acting IV of Amiloride.	Resonium Calcium polyacrylate Drug: Kayexalate (resonium calcium) MOA: binds K ⁺ , Ca ⁺⁺ , and Mg ⁺⁺ in the GI tract and excretes them Onset: 10-20 mins, 30-60 min (peak) Duration: 4-6 hours Dose: 15-30mg/kg, 10-40ml of 10% solution, 5pm started with 100mL of normal saline for a maximum of 2000mg per 24hrs if GI OK.
---	--	---	--

41

ACUTE management

- Calcium for HyperK
 - Interferes with the excessive excitation caused by K⁺
 - Blocks the K⁺ channels
 - CaCl in adults,
 - CaGluconate in peds

Only use Ca⁺⁺ if the QRS is wide!

$$V_m = \frac{RT}{F} \ln \left(\frac{p_K [K^+]_o + p_{Na} [Na^+]_o + p_{Cl} [Cl^-]_i}{p_K [K^+]_i + p_{Na} [Na^+]_i + p_{Cl} [Cl^-]_o} \right)$$

Goldman Hodgkin Katz equation

42

ACUTE management

- Insulin/Glucose
 - Insulin stimulates the Na/K pump and increases its activity. Moving K⁺ into the cell.
 - Glucose will correct any hypoglycemia associated with the insulin administration
- Albuterol
 - The Beta 2 properties increase activity of the Na/K pump and move K⁺ into the cell.

Check BGL levels – Glucose is not necessary in a hyperglycemic patient

43

ACUTE management

- Bicarbonate
 - Works on the H⁺/K⁺ exchange mechanism
 - As HCO3⁻ is added to the blood, H⁺ will leave the cell in an attempt to buffer the alkaline load and force K⁺ to move into the cell to balance the ICF charge.

3 D's

- The ONLY ways to REMOVE excess K⁺
 - Dialysis
 - Diarrhea (induced)
 - Kayexalate
 - Diuresis
 - Bolus with NaCl and administer a diuretic simultaneously

44

Hypernatremia

- Etiology
 - Dehydration
 - Water deprivation
 - Dietary intake
- Pathophysiology
 - net water loss or a sodium gain
- S/Sx
 - Intense thirst
 - HTN
 - Edema
 - Agitation
 - Convulsions

45

Hyponatremia

- Etiology
 - Excessive water intake
 - chronic vomiting or diarrhea,
 - Aldosterone deficiency
 - Dietary is rare
 - Diuretics
- Pathophysiology
 - Cellular edema
- S/Sx
 - Muscle weakness
 - dizziness
 - Hypotension
 - tachycardia
 - Altered mentation

46

ACUTE management

- **Hyponatremia**
- Acute Change in Na (occurred within 24 hours)
 - correct the serum sodium at rate of 2-3 mEq/L/h (maximum total, 12 mEq/L/d)
- Progressive change in Na - chronic sodium imbalance
 - corrected at a rate not to exceed 0.5 mEq/L/h and a total of 8-10 mEq/day
- If HYPERvolemic, salt and water restriction plus diuretics and V2 antagonists (ADH blockers)

- **Hyponatremia**
- Acute Change in Na (occurred within 48 hours)
 - Overtly symptomatic pt (S₂) will be treated with 3% (hypertonic saline).
- Progressive change in Na - chronic sodium imbalance
 - Free water restriction (<1 L/day)
- If HYPERvolemic, salt and water restriction plus diuretics and V2 antagonists (ADH blockers)

47

48

49

What if I correct too fast

50

Sodium case

27-year-old male presents with lightheadedness and hypotension after spending the day drinking alcohol at a local music festival.

51

Sodium case

Pt states that he has not been urinating despite significant alcohol intake.

- REMEMBER - Alcohol blocks ADH - He should be peeing like crazy!!!
- ADH Should cause people to retain fluids - preventing urination and therefore decreases plasma osmolality (increased plasma volume).

52

Sodium case

Summary of findings thus far:

Causation	Physiology	Outcome
Ingested ETOH	Blocks ADH	Water loss
Decreased H ₂ O	Vasodilated	Hypotension
Decreased urine output	ADH should cause water retention - or dehydration	Retain water
Hot temperature	Sweating	Water loss

53

Sodium case

Pt taken to the ED and iSTAT demonstrates the following:

- Na⁺ is 118mEq/L (normal is 135-145)
- BUN and Creatinine indicate some dehydration

What's the problem here?

54

Sodium case

- Na⁺ is 118mEq/L (normal is 135-145)
- BUN and Creatinine are slightly elevated (disproportionate to the Na⁺)

The sodium indicates the pt's plasma should be concentrated (hyperosmolar) but the minimalistic changes to the BUN/Creatinine indicate that the plasma volume is not reduced enough to give a Na⁺ of 118. In other words, he is NOT that dehydrated.

55

Sodium case

15 minutes after arrival in the ED, the iSTAT was repeated:

- Na⁺ is 146mEq/L (normal is 135-145)
- BUN and Creatinine are unchanged, and no new fluids have been given

Who can explain this?

56

Sodium case

- Upon further questioning:
 - The pt had a history of bed wetting that could not be controlled so he was prescribed DDAVP (desmopressin).
 - DDAVP is a nasal spray that works like ADH (vasopressin)
 - Extrinsic administration supersedes the intrinsic production...

57

Sodium case

Summary of findings thus far:

Causation	Physiology	Outcome
Ingested ETOH	Blocks ADH	Water loss
Decreased H2O	Vasodilated	Hypotension
Decreased urine output	ADH should cause water retention - or dehydration	Retain water
Hot temperature	Sweating ADH release to compensate -	Water loss Retain water
DDVAP	Acts like ADH	Retain water

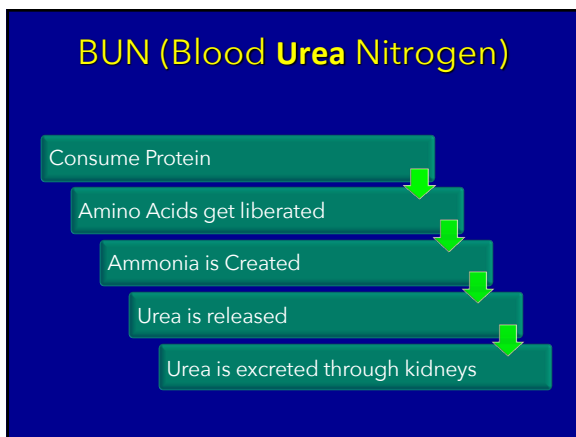

NET RESULT SHOULD BE WATER RETENTION WHICH MEANS HIS SODIUM SHOULD HAVE BEEN DILUTE (LOW)

58

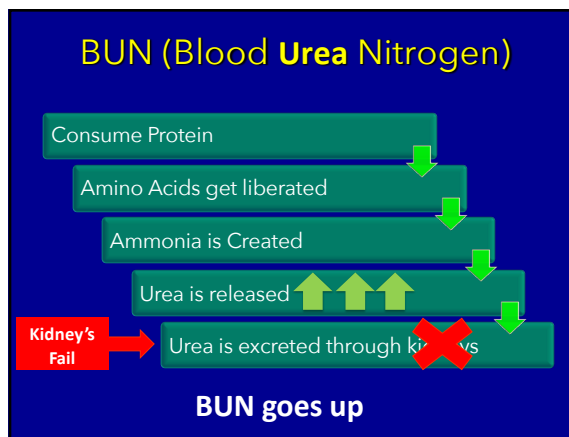

Sodium case

The Pt decided that he didn't want to use the porta-potties and as a result, took his DDAVP throughout the day. He continued to drink in the hot environment. As his body temp increased, he vasodilated. Because the DDAVP potentiated his ADH, his cells were dehydrated but his blood volume remained sufficient... His Na+ level was artificially low and once the DDAVP wore off, the pt stopped reabsorbing his sodium.

59

60

61

Acid Base Balance

Buffering Component - Instant

$$H^+ + HCO_3 \leftrightarrow H_2CO_3 \leftrightarrow H_2O + CO_2$$

Respiratory Component - Quick; minutes.

↑ Respirations = ↓ CO₂ ↓ H⁺ ↑ pH
 ↓ Respirations = ↑ CO₂ ↑ H⁺ ↓ pH

Renal (metabolic) component
 - slow; days.

62

Anion Gap Acidosis

■ **CAT MUDPILES**

- CO, cyanide, CHF
- Aminoglycosides
- Theophylline/Toluene
- Methanol
- Uremia
- DKA (any ketoacidosis)
- Paracetamol/Acetaminophen
- Iron/INH/Inborn errors of Metabolism
- Lactic acidosis
- Ethanol/Ethylene Glycol
- Salicylates

63

Acid-Base

Algorithm

1. Calculate AG
2. If AG is present, calculate the delta AG with corrected HCO₃⁻.
3. pH/PCO₂

AG = 12
pH = 7.4
HCO₃⁻ = 24

Metabolic etiology

Respiratory etiology

64

Case 1

pH	7.2
HCO ₃ ⁻	18
PCO ₂	24
Na ⁺	140
Cl ⁻	77

1. AG: 140- (18+104) = **18**
2. Δ AG: 18-12 = **6**
3. Corrected HCO₃⁻: 18+6 = **24**
4. pH = 7.23 (low) = **Acidosis**
5. pCO₂: 24 (low) = **not resp**

Anion gap acidosis

Normal

Algorithm

1. Calculate AG
2. If AG is present, calculate the delta AG with corrected HCO₃⁻.
3. pH/PCO₂

AG = 12
pH = 7.4
HCO₃⁻ = 24

65

Case 2

pH	7.23
HCO ₃ ⁻	9
PCO ₂	22
Na ⁺	140
Cl ⁻	77

1. AG: 140- (9+77) = **54**
2. Δ AG: 54-12 = **42**
3. Corrected HCO₃⁻: 9+42 = **51**
4. pH = 7.23 (low) = **Acidosis**
5. pCO₂: 22 (low) = **not resp**

Anion gap acidosis

Metabolic Alkalosis

Corrected HCO₃⁻ is much higher than the normal HCO₃⁻ of 24 = High HCO₃⁻ means a metabolic alkalosis was present before the AG acidosis suggesting a mixed imbalance

89 female with HX N/V/D x 3 days

AG = 12
pH = 7.4
HCO₃⁻ = 24

66

Case 3

pH	7.12
HCO ₃ ⁻	4
PCO ₂	13
Na ⁺	140
Cl ⁻	115

1. AG: 140- (4+115) = **21**
2. Δ AG: 21-12 = **9**
3. Corrected HCO₃⁻: 4+9 = **13**
4. pH = 7.12 (low) = **Acidosis**
5. pCO₂: 13 (low) = **not resp**

Anion gap acidosis

Non-gap acidosis

Algorithm

1. Calculate AG
2. If AG is present, calculate the delta AG with corrected HCO₃⁻.
3. pH/PCO₂

AG = 12
pH = 7.4
HCO₃⁻ = 24

67

THANK YOU!!
