

1

1 cause of disability among adults in the US

795,000 americans each year suffer a stroke

40% are large vessel occlusion

#5 cause of death among adults in the US

KILLS 128,000 people a year. That's about one out of every 19 deaths

EVERY 40 SECONDS someone has a stroke

- On average, 1 American dies from a stroke every 4 minutes
- 30-50% have lifelong disability
- Stroke costs US estimated \$34,000,000,000

3

A quick review of anatomy

Right = Execution
R = Agnosia

Left = cognition
L = Aphasia

4

A quick review of anatomy

Motor (precentral gyrus)

Sensory (postcentral gyrus)

5

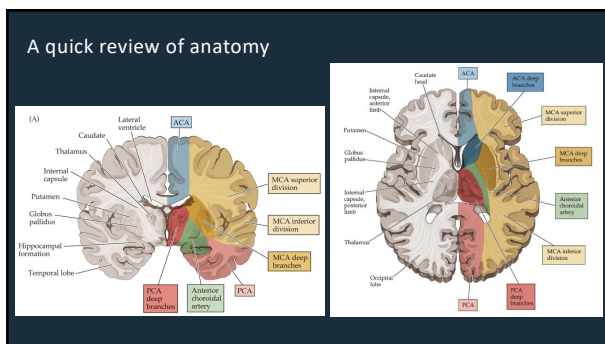

- ACA Lesion affects lower body
- MCA Lesion affects upper body
- Both on contralateral side

6

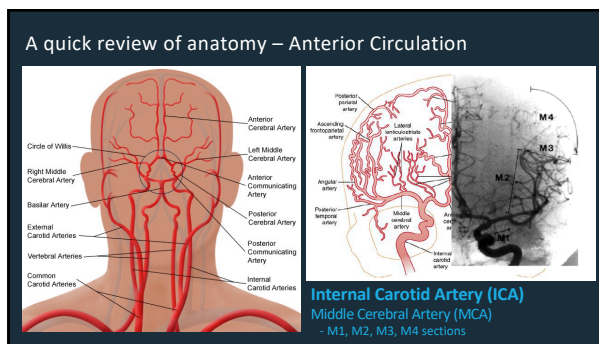

Location of the lesion

- Paralysis involves the contralateral face, arm, and leg
- If arm > leg, suspect lesion in distribution of MCA
- If arm = leg, suspect a deep hemisphere lesion
- If leg > arm, suspect anterior cerebral territory lesion
- Aphasia and/or seizures
- hemispheric cortical lesion
- Ataxia or dizziness
- cerebellar lesion

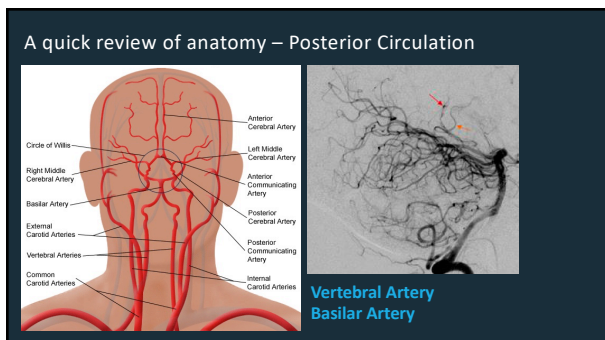

7

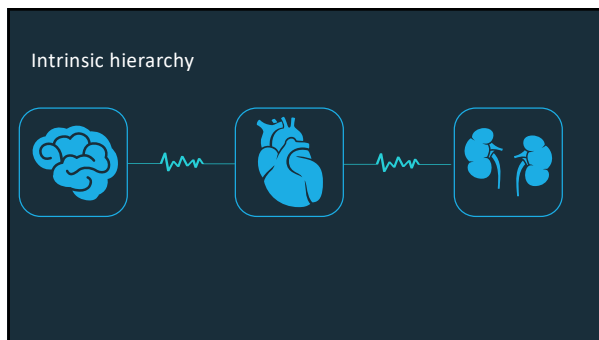

8

9

10

11

Important Physiology

12

13

Cerebral Perfusion Pressure

- $MAP = 1/3(\text{systolic} - \text{diastolic}) + \text{diastolic}$
- ICP 0 - 10 torr (20 upper limit)
- CPP 80 - 100 torr
- CPP drops below 60 torr = ischemia
- CPP <30 torr - incompatible with life

CPP = MAP - ICP

14

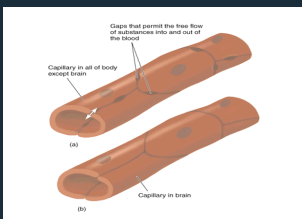

Cerebral Perfusion Pressure

- CPP correlated with CBF
- Decrease in MAP
- Increase in ICP
- Hypotension defined as systolic BP <90 mmHg
- Hypoxia
 - apnea
 - cyanosis
 - $SpO_2 < 90\% = PaCO_2$ of 60 torr

15

Physiology

- CSF - 25 ml/hour
- Blood brain barrier
 - tight capillaries
 - limit movements of solutes and water
 - glucose, oxygen, carbon dioxide, and lipid soluble substances (nicotine, caffeine, narcotics)

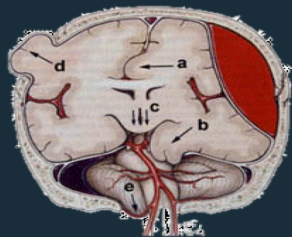

16

Monro-Kelli Doctrine

The volume in the rigid skull is equal to the sum of the brain (90%) + CSF + blood

A change in one compartment must be balanced by a change in another

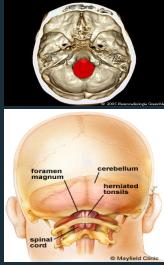

17

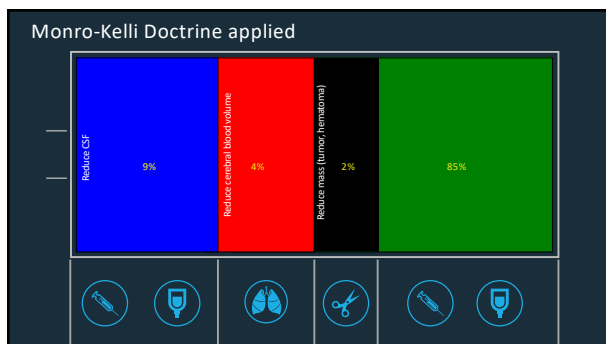

18

Monro-Kelli Doctrine

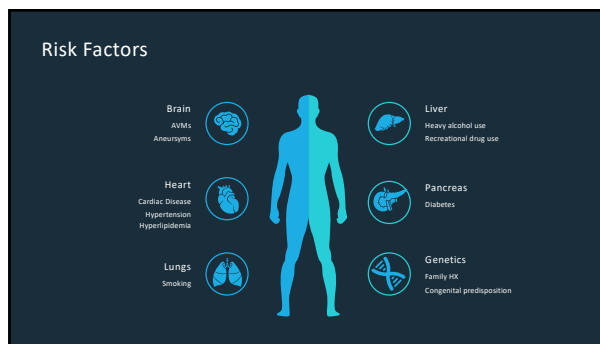

State	Brain (90%)	CSF	Blood
Normal	9%	4%	87%
Abnormal	4%	4%	92%
Abnormal	1%	0%	79%

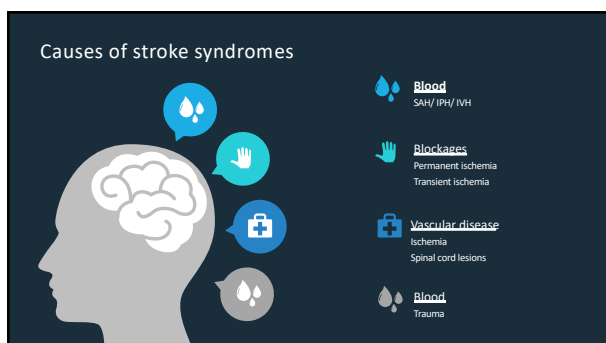

19

31

Clinical Findings

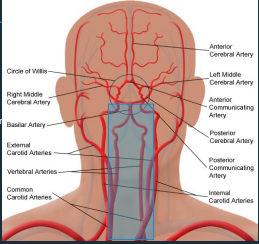

Left MCA	Right MCA	Brainstem
<ul style="list-style-type: none"> • Aphasia • Lack of comprehension • Left-sided gaze • Right-sided facial droop • Right-sided neglect 	<ul style="list-style-type: none"> • Dysarthria (slurred) • Left-sided weakness • Right-sided gaze • Left-sided facial droop • Left-sided neglect 	<ul style="list-style-type: none"> • Eye movement deficits • N/V • Ataxia/vertigo • Dysphagia • Dysphasia • AMS • Crossed signs – weakness & facial droop

32

Clinical Findings

Obstruction of Vertebrobasilar Circulation

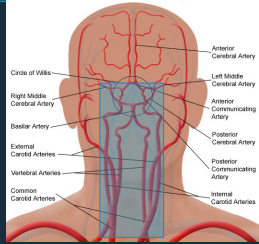

- Supplies:
 - Thalamus
 - Cerebellum
 - Brainstem
- Occlusion of both vertebral arteries or basilar artery:
 - Coma with pinpoint pupils
 - Flaccid quadriplegia
 - Sensory loss
 - Various cranial abnormalities

34

Clinical Findings

- Coma
 - Infarction in either carotid or vertebrobasilar system may cause loss of consciousness

35

Cath Lab no longer means just the Heart

Neurovascular stent retrievers.

first alternative to clot-busting drugs to treat emergency stroke patients
 wire-caged device can now be threaded through a patient's blood vessels to catch and remove clots from the bloodstream.

36

Right M1 MCA stroke

37

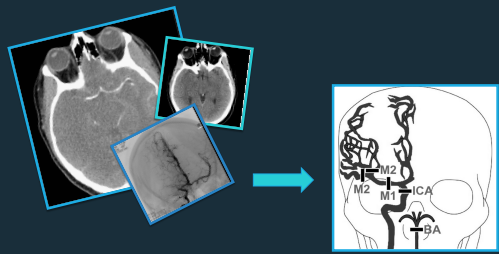

Clinical history

37 yr old woman

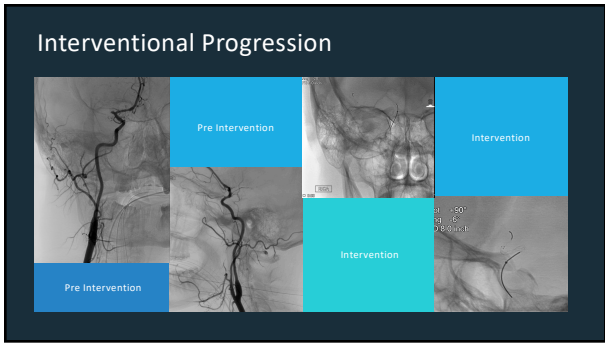

- While exercising at the gym, she lost balance and fell without LOC
- Last well 20:40 when she signed in to the Gym
- Developed right gaze preference, left neglect, hemiparesis and facial droop
- NIH 18
- IV tpa given at 2305 after head ct

Hemorrhagic Stroke – ICH Stroke Scale

Feature	Finding	Points	ICH Score	30 Day Mortality		
GCS	3-4	2	0	0%		
	5-12	1				
	13-15	0				
Age	≥ 80	1			1	13%
	< 80	0				
Location	Infratentorial	1			2	26%
	Supratentorial	0				
ICH volume	≥ 30 mL	1	3	72%		
	< 30 mL	0				
Intraventricular Bleed	Yes	1	4	97%		
	No	0				
ICH SCORE	0-6 points		5	100%		
					6	100%

51

DDx of Ischemic Stroke

- The most important is **intracranial hemorrhage**
- If a patient is comatose and no history is available, other diagnoses include:
 - Hypoglycemia
 - Drug overdose
 - Seizures
 - Craniocerebral trauma

52

Evaluation of Suspected Stroke

ABCD² Score

ABCD ² Criteria	Points
Age ≥ 60 years (add 1 point)	1
BP ≥ 140/90 mmHg at initial evaluation (add 1 point)	1
Clinical Features of the TIA:	
• Speech Disturbance without Weakness, or	1
• Unilateral weakness	2
Duration of Symptoms:	
• 10-59 minutes, or	1
• ≥ 60 minutes	2
Diabetes Mellitus in Patient's History	1

TIA

ABCD² Score

Low Risk TIA High Risk TIA

Discharged (Outpatient W/visit) Hospital Admit or Transfer

1-3 is low risk
4-5 is moderate risk
≥6 is high risk

53

An EMS favorite... Rapid Arterial Occlusion Evaluation

Test Item	0	1	2
Facial Palsy	Absent	Mild	Moderate/Severe
Arm motor	Normal/mild	Moderate	Severe
Leg motor	Normal/mild	Moderate	Severe
Head/Gaze deviation	Absent	Present	N/A
Aphasia (R hemiparesis – L injury)	Performs both tasks	Performs 1 task	Performs neither tasks
Agnosia (L hemiparesis – R injury)	Patient recognizes arm & impairment	Unable to recognize arm or impairment	Unable to recognize arm or impairment

RACE SCORE 0-9 points

Aphasia:
1. Ask patient to close eyes
2. Ask patient to make a fist

Agnosia:
1. Ask patient, after lifting prostetic arm, who's arm is this?
2. Ask patient to lift both hands and clap

>4 ~ LVO

54

RACE (Rapid Arterial Occlusion Evaluation)

Item	Instruction	RACE score	NIHSS score equivalent
Facial palsy	Ask the patient to show teeth	Absent (symmetrical movement)	0
		Mild (slightly asymmetrical)	1
Arm motor function	Extending the arm of the patient 90 degrees (of sitting) or 45 degrees (if supine)	Moderate to severe (asymmetry)	2
		Normal to mild (arm upheld more than 10 seconds)	1
		Moderate (arm upheld less than 10 seconds)	2
Leg motor function	Extending the leg of the patient 90 degrees (in supine)	Severe (patient do not rise the arm)	3
		Moderate (arm upheld more than 5 seconds)	1
		Moderate (arm upheld less than 5 seconds)	2
Head and gaze deviation	Observe eyes and cephalic deviation in one side	Absent (no movements to both sides were possible and no cephalic deviation was observed)	0
		Present (eyes and cephalic deviation to one side was observed)	1
Aphasia	Ask the patient two verbal items "Close your eyes" "Make a fist"	Normal (performs both tasks correctly)	0
		Severe (performs neither tasks)	1
		Moderate (performs one task correctly)	2
Agnosia	"What is this arm" while showing him/her the patient's arm (nonparese)	Severe (cannot name)	0
		Moderate (misnomenclature or nonspecific)	1
RACE Score total		0-9	

Stroke is likely with a score above 1

Emergent Large Vessel Occlusion is likely if the cumulative score is > 4

with a sensitivity of 85% and specificity of 69%.

The Accuracy of Large Vessel Occlusion Recognition Scores in Ischemic Stroke: A Retrospective Cohort Study. Patel AM, et al. Stroke. 2015;46(12):3575-3578. Published online 2015 Nov 6.

Evaluation of Suspected Stroke

NIH Stroke Scale – the GOLD STANDARD

- Level of consciousness**
0 alert
1 drowsy
2 stuporous
3 comatose
- LOC questions (month, age)**
0 both correct
1 one correct
2 incorrect
- LOC commands (close eyes, make a fist)**
0 both correct
1 one correct
2 incorrect
- Best gaze**
0 patient gaze
1 partial gaze palsy
2 bilateral deviation
- Visual fields**
0 normal field
1 partial loss
2 complete loss
3 bilateral hemianopia
- Facial palsy**
0 normal
1 minor
2 partial
3 complete
- Motor (L/R arm + leg)**
0 no effort
1 drift
2 full range gradually
3 full range purposefully
4 no movement
- Arm pronator/supinator function**
0 normal
1 limb ataxia (finger/heel, hand/heel/shin)
2 impaired
- Sensation (pinprick)**
0 normal
1 partial loss
2 severe loss
- Best language**
0 no aphasia
1 mild word repetition
2 severe aphasia
3 mute
- Dysarthria**
0 normal
1 mild word
2 severe to unintelligible or worse
3 total muteness
- Extinction and inattention**
0 no neglect
1 partial neglect
2 complete neglect
